

Release notes

- Software application: SEGMA
- Version: 0.3.2
- Release date: June 1st, 2021
- Author: Benoît St-Onge (GeoPhoton), bso@geophoton.ca

Improvements

- SEGMA now generates a point layer, in addition to the polygonal layer containing the crowns. The position of the points (stems) corresponds to the values of Centroid_X and Centroid_Y from the attribute table. The same attributes are attached to both the crown and point layers.
- The GUI allows you to choose different output folders respectively for crowns and points as well as different suffixes for the corresponding output file names.
- Fixed an omission that caused processing to slow down in areas almost entirely devoid of trees (e.g., lake shores).
- The French version is now complete (console messages and attribute names have been translated).
